

NPM vs YARN

Using NPM or Yarn is a personal choice. You can use this as a reference guide for the two different commands you can use.

Install dependencies from package.json: `npm install` == `yarn`

Install a package and add to package.json: `npm install package --save` == `yarn add package`

Install a devDependency to package.json: `npm install package --save-dev` == `yarn add package --dev`

Remove a dependency from package.json: `npm uninstall package --save` == `yarn remove package`

Upgrade a package to its latest version: `npm update --save` == `yarn upgrade`

Install a package globally: `npm install package -g` == `yarn global add package`
